

(a) Actual event sequence example — 20260620

(b) Automated latency: usable normal nights

(c) Human-review proxies and MPC round trips

(d) Evidence and exception status (distinct nights)

Usable normal	2	1	2	N/A	N/A
Historical rerun	1	1	1	N/A	N/A
Latest mtime only	129	125	129	N/A	N/A
Negative latency	0	10	0	N/A	N/A
Restart anomaly	0	0	0	N/A	N/A
No evidence	115	115	115	N/A	N/A
	Automated	Human	MPC	CPU	RAM

CPU: unavailable slurm accounting disabled | RAM: unavailable slurm accounting disabled

Exception rows may overlap; CPU/RAM cells are N/A, never zero-filled.

p50/p90/p95 eligibility is per metric: finite nonnegative, normal-daily, no restart/reboot or explicit primary-quality exclusion. A negative human proxy does not remove valid automated metrics from the same night. Historical reruns and latest-mtime-only values remain audit context. Human intervals are wall-clock mtime proxies; inventory product timestamps are latest mtimes, not creation times; MPC intervals include transport and external response time.
